- The design process of underground structures especially tunnels are based on Engineering Classifications which is significant part of the Empirical and Observational Approach.
- Every System/Technique/Method has a specific scope and limitations owing to the vast complexity of the Nature.
- The I-system is a Comprehensive way for Classification and Characterization of ground. It provides two outputs (I)-Class & (I)-GC.
- The USBRL T01 project has been selected for the Data collection for the investigation of the Geo-mechanical properties.
- Statistical Methods have been adopted for data processing and Regression analysis have been performed to obtain accurate results

Evaluation of data pairs for Modulus of Deformation of the Ground (E_g)

Step I – Computation of (I)-Value
for 100 cases using I-System's
Software.

(I) = (Ai + Ci + Hi + Pi + Si) x DFi x ETi *Bineshian (2019, 2020, 2021)*

Ai	ARMATURE INDEX	0.00
	Discontinuity Number/s - per m	≥ 25
	Discontinuity Set/s	≥ 4
	Discontinuity Inclination - °	61 - 90
	Discontinuity Aperture	Tight
	Discontinuity Disintegration	Semi-Integrated
	Discontinuity Friction	Moderate Friction - Nonsmooth
	Discontinuity Persistency	< 0.90 x D
Ci	CONFIGURATION INDEX	2.45
	Problematical Configuration	Sheared - High Shear Stresses - e
	Structural Configuration	Coarse Grained Skeleton
Hi	HYDRO INDEX	5.50
	Ground Conductivity (GCD) or [Wetness]	(10 - 14) or [Drip]
	Ground Softness - Mohs	5
Pi	PROPERTIES INDEX	14.80
	Cohesiveness Consistency	Large Size Particles
	Denseness Consistency	Never Indented by Thumbnail
	Particle Size	n/a e.g., Rock
	Particle Morphology	n/a e.g., Rock
	Body Wave Velocity - m/sec (Vp) or [Vs]	(4999 - 4500) or [2899 - 2600]
Si	STRENGTH INDEX	16.20
	UCS	100 MPa
	Scale Effect	B/H = 1.20 - 0.80 & ov < sh
DFi	DYNAMIC FORCES IMPACT	0.85
	(PGASD) or [ERZ] or [MSK]	(0.36g - 0.50g) or [VH] or [IX-X]
ETi	EXCAVATION TECHNIQUE IMPACT	0.90

Step II – Derivation of (I)-GC properties from (I)-Value using I-System's Software

I-System - Index of Ground-Structure *Bineshian (2019, 2020, 2021)*

(I)-GC; I-System's Ground Characterization

(I) = 27
Selected UCS range is 74 - 50 MPa.
Specified α_c Value = 50 MPa

Modulus of Deformation
 $E_g = 2.857$ GPa

Poisson's Ratio
 $\nu_g = 0.392$

Unconfined Compressive Strength
 $\sigma_{cg} = 1.350$ MPa

Uniaxial Tensile Strength
 $\sigma_{tg} = -0.073$ MPa

Cohesion
 $C_g = 10.416$ KPa

Internal Friction Angle
 $\phi_g = 29.850^\circ$

(I)-GC characterizes the ground based on (I); however, it is recommended to scrutinise it by deriving the mechanical properties of ground by standardised in-situ testing methods.

I-System - Index of Ground-Structure *Bineshian (2019, 2020, 2021)*

Step III – Derivation of Rockmass Properties using RSData Software

The screenshot shows the RSData software interface for Case No. 7 USBRL T1P2 CH 32148.00. The interface includes a menu bar (File, Edit, View, Analysis, Materials, Failure States, Tests, Stress Paths, Calibrate, Compute, Help), a toolbar, and several panels:

- Visibility Panel:** Shows 'Rock Template' with 'Material Model (Rock)' and 'Failure States' containing 'State 1'.
- Properties Panel:** Shows 'Name: Rock' and 'Strength' tab with 'Failure Criterion: Generalized Hoek Brown'. A table lists material parameters:

Type	Data
Material Type	Plastic
Define by	GSI, mi, D
Peak Strength	
UCS of intact rock (intact)	50
GSI	35
mi	9
D	0
Set Residual to Peak	<input checked="" type="checkbox"/>

- Principal Stress Plot:** A graph of Major Principal Stress (MPa) vs. Minor Principal Stress (MPa). The curve shows a non-linear relationship, starting at (0,0) and reaching approximately (3.5, 14).
- Normal/Shear Stress:** A graph of Shear Stress (MPa) vs. Normal Stress (MPa). The curve shows a non-linear relationship, starting at (0,0) and reaching approximately (6, 4).
- Properties Table:** A table on the right side of the interface lists various rock mass parameters:

Rock	
Hoek Brown Classification	
UCS of intact rock (MPa)	50
GSI	35
mi	9
disturbance factor	0
Intact Modulus (MPa)	21250
Hoek Brown Criterion	
mb	0.883
s	0.00073
a	0.516
Rock Mass Parameters	
tensile strength (MPa)	0.041
uniaxial compressive strength (MPa)	1.204
global strength (MPa)	5.893
modulus of deformation (MPa)	1204.949
Failure Range Envelope	
application	Tunnels
sig3max (MPa)	3.191
Mohr Coulomb Fit	
cohesion (MPa)	0.767
friction angle (°)	36.085

Purification of the Data Pairs

A total of 100 cases of TDP data pairs were plotted in a scatter plot between (I)-Value vs Geo-mechanical property. The plot highlighted the data pairs not following the trend. As per the principles of rock mechanics the value of Geo-mechanical property included in this study that are (Eg, Cg, ϕ g) shall always increase with increase in strength of the ground. This means that the values of these Geo-mechanical properties should increase/decrease with increase/decrease in (I)-Value. Based on such conditions a purification technique was applied to eliminate the data pairs.

- i. The data pairs representing lower value than the previous data pair were eliminated in an increasing trend and vice versa if necessary.
- ii. The data pairs far away from the trend were eliminated.
- iii. For the data pairs showing different Y values for same X values, the Data pairs obtaining better Coefficient of Multiple Determination (R^2) value were selected.

ASSOCIATION

Step IV – Sorting of TDP (T-01 Data Pairs) as per ascending I-Value:

- The data pairs are in the form of (X, Y) where X represents the (I)-Value and Y represents Modulus of Deformation of the ground (E_g).
- The table summarizes total case count of 100 cases for the Modulus of Deformation of the ground (E_g) based on the (I)-Value and sorted as purified and unpurified in black and red colour respectively. Out of 100 cases 39 cases were eliminated and 61 cases were selected for regression analysis with maximum coefficient of multiple determination value (R^2) as 0.999

Modulus of Deformation of the ground Eg TDP Summary			
(I)-Value	Eg (GPa) I-System	Eg (GPa) RS Data	Total Data Pairs

Evaluation of data pairs for Cohesion of the Ground (C_g)

- The initial chainages of the USBRL project was constructed with conventional as well as NATM methods. Both the methods produced numerous failures and collapse for several times.
- Due to termination of various agencies, the project has insufficient data for evaluation of Cohesion of the ground from the site and hence a modification or correlation cannot be established using the TDP data pairs. Though the need to modify the original equation due to ultra conservative output by the (I)-GC for the Cohesion of the ground (C_g) is assessed.
- To propose the modification to improve the accuracy of the original equation of Cohesion of the ground (C_g) the source data presented in has been obtained from the standard reference notes and geotechnical references.

Concluding Remarks

- After the thorough analysis and its interpretation, the New Equation for the (I)-GC's Modulus of Deformation of the ground (E_g) proposed for the (I)-Value ranging between 20-40 is

$$E_g = e^{0.07 \times (I)} - 4.50$$

- After the thorough analysis and its interpretation, the New Equation for the (I)-GC's Cohesion of the ground (C_g) proposed for the (I)-Value ranging between 20-40 is

$$C_g = e^{0.03 \times (I)} \times 73.00$$

- After the thorough analysis and its interpretation, the Original Equation for the (I)-GC's Internal Friction Angle of the ground (ϕ_g) proposed to keep same for the (I)-Value ranging between 20-40 is

$$\phi_g = 15 + 0.55 \times (I)$$

INTERNATIONAL TUNNELLING
AND UNDERGROUND SPACE
ASSOCIATION

I thank TAI, TAlym and all the organizers, co-organizers and the industry experts for providing us the International Platform with such high standards and exposure.

Lastly, we would also thank our Head of Tunnel Engineering Department, MIT WPU, Dr. Sandeep Potnis and Dr. Bineshian Hoss for his continuous support and guidance.

Wishing all Safe and Happy Tunnelling!

Thank You
